The allocation of channels between voice and data is controlled by the base station, but once a channel is allocated to the PCU, the PCU takes full control over that channel.

The present-day tele-space is incomplete without the base stations as these constitute an important part of the modern-day scheme of wireless communications. They are referred to as cell ...

There are multiple functional division schemes between CU and DU, which can adapt to different communication scenarios and different communication requirements. This article ...

The document describes various radio frequency (RF) baseline parameters for cellular networks, including network identity, paging, cell selection and reselection, and other parameters.

If you are working in cellular communication industry or studying seriously in this area, you know you have to live with a huge set of specification documents called 3GPP TS (Test Specification).

Communication management: The base station also manages various communication details, such as allocating communication channels and controlling signal strength.

It also includes the following functions: The BSC manages the radio resources for one or more BTSs. It handles radio channel setup, frequency hopping, and handovers. ...

Do base station parameters affect the communication module

Many other parameters (complexity, signal quality, area, cost, and so on) to design 5G systems should be considered and many of them have a trade-off relationship. The chapter reviews the relationship ...
