For the AC high voltage error, the error is caused when the voltage exceeds what is set on the GS8048 -> AC Input tab. Default setting is 132V per leg or 264V across both legs.

Thus, the output voltage of the solar inverter will be high, which will trigger the inverter protection function and the inverter working will be stopped. Under this situation, there are three ...

Most string inverters have a normal voltage operating range, but that range can usually be extended by 10% or so. Usually if they need the upper voltage limit to be raised, you'll have to call the ...

There's nothing the MPPT can do to force the panels to operate at something higher than the Voc for their current operating conditions. This is good to know.

If your solar inverter is triggering a "peak voltage too high" error, you're not alone. This common issue can reduce energy efficiency, damage equipment, and even stall renewable energy projects.

We've narrowed the issue down to getting too much AC voltage from the grid. The problem however, is that line voltage reads any from 247-252 Vac, but once the inverters (2 ...

Looking online, seems someone else had this problem and it may either be that a firmware update is needed or that the wire gauge is too small. I'm trying to figure out what the proper wire gauge should ...

Facing AC overvoltage issues in your solar inverter system? Learn the causes, step-by-step and effective preventive measures to maintain stable energy output.

Since the electric energy generated by the photovoltaic system cannot be consumed nearby, and the long-distance transmission point cannot be realized, the natural grid voltage will ...

Photovoltaic power inverter AC voltage is too high

output voltage peaked too high Hi, I have installed an EaySolar-II-GX that is currently off grid. It was working fine for 2 days then last w/e it went to 300V and raised an overload L1 alarm ...
