What is a water light injection?

The injected substance can be called a "water light injection". We use the Introfill water light syringe, and each injection will have 9 needles to simultaneously inject the skin promoter into the bottom layer of the skin.

What is a water-light injection & how does it work?

The water-light injection contains hyaluronic acid, and its main effect is to moisturize and lock water for the skin. In addition to hyaluronic acid, later water-light injections will also add different ingredients, such as vitamins, growth factors and minerals, to target different skin problems.

Why should you use a water light syringe?

The Introfill water light syringe can adjust the depth and dosage of entering the skin, so the amount and coverage are more average than manual injection. The amount of skin promoter can be controlled within the specified amount, and injected into the dermis of 0.5-3mm, and the depth and injection site are also more accurate.

The water-light needle directly delivers hyaluronic acid to the dermis, solving the problem of skin water shortage from the root cause, and the effect is more direct and significant.
