In this study, the solar energy sector has been examined in detail under the lens of Covid-19. The effect of the covid-19 outbreak on the sector has been tried to be measured and the ...

Solar PV capacity additions are forecast to decline 17% from 2019 to 2020, while wind additions shrink 12%. Utility-scale PV and wind are expected to rebound, as the majority of projects in development ...

Looking at all the data so far on how the Covid-19 crisis is impacting clean energy transitions, 10 key themes emerge - and this article examines each of them.

With an unprecedented effect, the new coronavirus, known as SARS-CoV2, has succeeded to seize the control of most cities of the world and led to their closure. The newly-emerged virus has also resulted ...

We already know that solar power accounts for less than 2% of global electricity generation. Solar energy may be converted directly or indirectly into different energy types that we ...

This study examines the impact of the COVID-19 pandemic on renewable energy sectors across seven countries through techno-economic analysis and machine learning (ML).

This research specifically focuses on examining the impacts of COVID-19 on solar and wind energy, thereby deeming the authors' consideration of electrical load fluctuations and variations ...

To minimize COVID-19's impact on renewable energy development and assist in building offshore wind power plants, economic and financial measures have been put in place to reduce the ...

It was found that the COVID-19 pandemic increased the low-carbon power generation by 4.59% (0.0648 billion kWh), mainly driven by solar and wind power generation, especially solar ...

The epidemic has little impact on solar power generation

Thus far, experts have observed the various impacts that the pandemic has on the renewable energy sector. On the one hand, decreasing production costs and greater availability of power systems have ...
