What is a uninterruptible power supply (UPS)?

A UPS, or a uninterruptible power supply, is a device used to backup a power supply to prevent devices and systems from power supply problems, such as a power failure or lightning strikes.

Why should you install a UPS system in a substation?

With UPS installations in plants and substations, you can guard against downtime throughout your entire infrastructure. Avoid the irony of a power plant without power with uninterruptible power supplies to ensure the continuity of the utility's supply and minimize disruptions.

Do uninterruptible power supply systems provide protection?

“Uninterruptible power supply systems provide protection.” IEEE Industrial Electronics Magazine 1, no. 1 (2007): 28-38. . Rahmat, M., S. Jovanovic, and K. L. Lo. “Reliability and availability modelling of uninterruptible power supply systems using Monte-Carlo simulation.”

What is the difference between a UPS & energy storage?

UPS Definition: A UPS (Uninterruptible Power Supply) is defined as a device that provides immediate power during a main power failure. Energy Storage: UPS systems use batteries, flywheels, or supercapacitors to store energy for use during power interruptions.
